

## **TG Alerts**

An alert is a cost-effective communication solution that allows care team members to communicate and coordinate with each other, resulting in more efficient coordination of care and management of patients. The alerts deliver real-time notifications to the care team whenever patients experience care events, and leverage the HIE's collection of the admit, discharge and transfer (ADT) data.

### **Alerts Improve Outcomes for seamless care transitions**

- Enables easy patient monitoring and follow-up, especially for high-risk, high-utilization populations.
- Enhances care coordination, shortening time to treatment and intervention, to improve outcomes.
- Supports seamless care transitions and enhanced provider communication/collaboration across the care community.
- Allows payers and providers access to daily reports about patient admissions and discharges across the network.
